With contributions from nationally recognized clinicians and researchers, this volume addresses the wide range of psychological issues inherent in pediatric oncology, including coping with pediatric cancer, pain and symptom management, medication compliance, neuropsychological effects of disease and therapy, sibling and family relations, bereavement, and care of the dying child.

Twenty to thirty years ago, the prognosis for children with cancer was dismal. Since then, remarkable advances in the treatment of childhood cancers have resulted in overall cure rates of 60 percent. In response to these improved prognoses, psychological frontiers of patient care and clinical research have evolved. Psychologists as well as mental health professionals from other disciplines are now routinely included in medical treatment planning and patient care. Psychosocial interventions with pediatric cancer patients and their families are guided by an increasingly sophisticated body of research findings that enhance their quality of life.

Each author carefully defines his or her research area, discusses theoretical and methodological concerns, critically reviews and integrates research findings, and discusses unresolved issues as well as future directions for research. This balanced and comprehensive overview of pediatric psychooncology is essential reading for all those interested in the treatment of children diagnosed with cancer.
