Provides a unique and highly effective approach to tumor diagnosis for practicing pathologists.

This valuable bench guide offers the most up-to-date information for all pathologists and histopathologists working to diagnose tumors and tumor-like conditions.

For the second edition, every subject has been reconsidered, and refined. The original sections have been retained, the first giving the detail of the patterns to be found, and what they indicate. The second part is an A to Z of Tumors and Tumor-like Conditions (such as Pseudomalignancy), designed to be referred to during practical laboratory work. Radical improvements include: a detailed introduction to pattern analysis for residents, more than 1,600 completely new, high quality, full-color images, providing the best possible examples for comparison; an expanded lymphoma section, and a revised format for even easier use during practical work.
