PsycTESTS™

Rely on Ovid as the trusted solution that transforms research into results

An extensive collection of psychological measures, scales, surveys, and other instruments essential to the research needs of professionals, students, and educators across the behavioral and social sciences.

Focused on a collection of instrumentation tools developed for research but not made commercially available, PsycTESTS helps researchers easily find scales and measures for their own use. PsycTESTS is an indispensable resource for researchers looking to conduct, create, or measure research in multiple fields of study. The database's coverage focuses on both published and unpublished tests developed by researchers but not made commercially available.

Each record includes a summary that describes the test, with its purpose; some history of its development; data on the scope of the test, test implementation, a high-level overview of the test's development, and reliability and validity data (when available).

Most records link to a variety of materials describing the test in peer-reviewed literature, technical reports, or dissertations as well as links to related peer-reviewed literature describing test development, review, or use. Most records also include the actual test instrument.

The following are just some examples of the types of measures, scales, inventories, questionnaires, and tests included:

- Neuropsychological Assessment
- Educational Measures
- Intelligence Tests
- Developmental Measures
- Scales for Beliefs, Relationships, or Expectancies
- Personality Assessment
- Aggression, Coping, or Functional Status Questionnaires
- Occupational Measures (I/O)
- Resilience, Anger Response, or Substance Abuse Inventories
- Military Testing
